Abstract:

Our main project is three axis pneumatic modern trailer works on the principles of pneumatic mechanism along with micro controllers. In this project the efficiency of dumping trailers will increase. The unloading of materials can be done to the three directions. This is very useful in the shipping industry. We are choosing this project for the decreasing the man power and time. The combination of pneumatics and micro controllers can be seen in our project. We have chosen this project because of the various attractiveness of pneumatics

Keywords: Pneumatic cylinder, Trailer, Viper motor, Flow control valve, Micro controller.

I. INTRODUCTION

Material handling in construction and civil works is one of the basic necessities. The material supply to civil and construction is provided through trucks, dumper etc. The material should be properly loaded, managed, stacked, transported and unloaded. The dumper carries the material which is loaded from the site, where the material is initially stored. It is then loaded to the dumper and transported to the required site and then unloaded. The major issues raises over here, the incompatibility of the site with the fully loaded dumper causes a lot of settling time for the trolley to get the material properly arranged and transportation time to reach its location. The dumper unloads the material in only one direction. But this incapability can be full new method mechanism as the "Three Axis Modern Pneumatic Trailer". Gothic mechanism is an approach to reduce the idle time to settle the dumper. The material is unloaded in any direction and hence can be boldly stated as "three axis modern pneumatic trailer". The major outcomes of "three axis modern pneumatic trailer". Has overcome space requirement which often result in road blocking. Hence, we have inversion in the existing mechanism providing the unloading in 180 rotations. This mechanism prevents blocking of road, saves time and enhances productivity at lowest cost. The automotive sector is fast booming section in India. There are variable in automotive industry light and heavy motor vehicle. Heavy duty vehicle support as the backbone and confront to the working, a dumper whose material can easily be unloaded in one direction that is mostly to its rear end. These inefficiency is been overcomes three axis modern pneumatic trailer. Automation can achieved through computers, hydraulics, pneumatics, robotics, etc., of these sources, pneumatics form an attractive medium for low cost automation. Automation plays an important role in automobile. Nowadays almost all the automobile vehicle is being atomized in order to product the human being. The automobile vehicle is being atomized for the following reasons.

- To achieve high safety.
- To reduce man power.
- To increase the efficiency of the vehicle.
- To reduce the work load.
- To reduce the fatigue of workers.
- To high responsibility.
- Less Maintenance cost.

II. BASIC IDEA

This idea was came from the visited a constructional site few days ago. There we found that a dumper was unloading loose material such as sand, gravel, and dirt. A trailer is an integral part of any construction work and hence its role is important for completion of work on site. Typical trailer trucks can generally unload material.... only exactly of its back side. One thing was remarkable that on complicated locations such as on angular sides and directional sides (left and right) of dumper the unloading of material became quite difficult. In such conditions dumper truck remained ideal. It consumed extra. Trailers are also the most common cause of accidents involving construction site and plant also. A typical dump truck is equipped with a pneumatically operated open box dead hinged at rear. The front of which can be lifted up to allow the contents to be deposited on the ground behind the truck at side of delivery. Nowadays dumpers with swivel skips could be rotated to sideways (3 directional trailer) which become popular, especially for working in narrow sites such as road works. But still this technology is insufficient for fulfilling our requirement for complete unload. This technology concerns only on solving the problem of unloading on directional sides of trailer. One of the problems is cited with dumper in the time & energy for operating the huge dumper in the proper direction to dump the material carrying in it hence the need of project work riser was is about Three Axis Modern Pneumatic Trailer which dump the material in any direction with moving trolley in any direction. With rise of chances in technology, it is become essential to find a viable alternative to 3 way trailer system.

III. WORKING PRINCIPLE

The material is unloading process is done in three axis with the help of locking arrangement and pneumatic system. The micro controller is used to control the flow direction of the pneumatic cylinder in both the direction. The pneumatic cylinder is mounted in the rotating table with locking arrangement.

IV. LITERATURE REVIEW

P. Shashidar, P. Laxminagaprasad, U. Anil Kumar, studied the,, design of different trollies and chassis. In industrial and domestic considerations, tippers can pull a variety of products

including gravel, grain, sand, fertilizer, heavy rocks, etc. The older dropping trolley/dumper has been conceived by observing the difficulty in unloading the materials. Prof. Deshmukh.S.A., Lonkar Pradip P, Bhong Tushar H, studied the,, regard in several automobile garages, revealed the facts that mostly some difficult methods were adopted in unloading the materials from the trailer. The trailer will unload the material in only one direction. It is difficult to unload the materials in small compact streets and small roads. In these journal they are rectified to unload the trailer in all three sides very easily. Amboji S. R. et al [2] studied that Tipper has lots of applications in today's world. In industrial and domestic considerations, tippers can haul a variety of products including gravel, potatoes, grain, sand, compost, heavy rocks, etc. By considering wide scope of the topic, it is necessary to do study and research on the topic of tipper mechanism in order to make it more economical and efficient. In existing system, tipper can unload only in one side by using hydraulic jack or conveyor mechanism. By this research it is easy for the driver to unload the trailer and also it reduces time and fuel consumption. For making tipper mechanism with such above conditions both mechanisms namely hydraulic jack and conveyor mechanism can be used. But eventually it comes with question that how both systems can arrange in single set up? Answer to this question is nothing but this research work. Alley & McLellan[3] of Glasgow studied hydraulics was being incorporated into truck mounted dump bodies relatively early on, in which record shows one of the first hydraulic dump bodies was the Robertson Steam Wagon with a hydraulic hoist that received power from the trucks engine or an independent steam engine was developed another early hydraulic dump body in 1907 that was power-driven by steam.

V. BACKGROUND

Air power system is a power transmission system in which the transmission of power takes place through a air medium. Such a system avoids the mechanical linkages such as gears, belts, ropes, chains etc. to a great extent of a conventional power transmission system. The transmission of power by fluid power system is most convenient and highly efficient. Due to this, the present conventional transmission systems are being replaced and changed over to air power based systems to a pump or compressor which is used to pressurize air. The mechanical energy supplied by the prime mover is converted into the pressure energy by the pump and it is stored as compressed air.

The pressurized air is now transmitted to different parts of the system through special piping's or tubing's. The various parameters such as pressure and flow rate of the air can be controlled by using various control valves. At the desired places of use, the air energy is converted back into mechanical energy by the devices called actuators consisting of cylinders, motors etc. Thus the energy supplied by the prime mover has been transmitted conveniently through fluid medium to various places and at these places, the mechanical energy has been recovered back in a more convenient form. Since the power is transmitted through the air as a medium, therefore such a system is called as pneumatic power system.

A. Construction

Figure.1. Constructional details for Pneumatic system

Major Parts:

The major parts pneumatic three axis modern tipper is described below (Fig. 1.)

- Air compressor.
- Direction Control Valve.
- Cylinder.
- Connecting hoses.
- Flow control valve.
- Bearing with bearing cap.
- Wheel arrangement.
- Vehicle model frame.
- Rotating Plates.
- Lay shaft.
- Frame.
- Locking system.

VI. DESIGN CONSIDERATION

- **INTRODUCTION:** In our attempt to design a pneumatic robot, we have adopted a very careful approach. Total design work has been divided into two parts mainly,

1. System Design.

2. Mechanical Design.

System design mainly concern with the various physical concerns and ergonomics, space requirements, arrangements of various components on the main frame of machine, number of controls, positions of this controls, ease of maintenance, scope of further improvements, height of machine components from the ground etc. In mechanical design, the components are categorized into two parts.

1. Design Parts.

2. Parts to be purchased.

For design parts, detailed design is done and dimensions thus obtained are compared to next highest dimensions which are readily available in the market. This simplifies the assembly as well as post production servicing work. The various tolerances on work pieces are specified in the manufacturing drawing. The process sheets are prepared and passed on to the manufacturing stage. The parts are to be purchased directly are specified and selected from standard catalogues.

• DESIGN OF PNEUMATIC COMPONENTS

1. Vertical piston design:

For designing the vertical piston, need to apply the clavarinos equation because the material of the piston is ductile material as an aluminum having the tensile stress of 200 N/mm². Clavarinos equation. Material of the piston is Aluminum, $\sigma_t = 200 \text{ N/mm}^2$ Assume, $p = 3 \text{ bar} = 0.3 \text{ N/mm}^2$, $\mu = 0.36$, $r_i =$

12.5 mm $t = 0.015$ mm By considering F.O.S. $1.5 t = 0.015 \times 1.5 = 0.023$ mm.

But in market the piston cylinder having minimum thickness of 0.5mm is available. So we choose the cylinder having thickness of 0.5 mm. Available thickness, $t = 0.5$ mm

2. Piston rod design:

As the slenderness ratio (l/k) is less than 40 (As length is very small), we can use the following relations:

$$d = D \sqrt{p/\sigma_t} \dots \dots \dots (1)$$

$$d = 25 \times \sqrt{3 / 200} \quad d = 3.06 \text{ mm} \quad d \approx 5 \text{ mm} \quad \square \text{ Rankine's}$$

Formula For Al, $\sigma_t = 150 \text{ MPa}$ $\sigma_u = 225 \text{ N/mm}^2$ $d = 2.616 \times 103$ $d = 5 \text{ mm}$ (Dia. of piston rod).

VII. ADVANTAGES AND DISADVANTAGES

Some of advantages are as follows:

- Lifting cost will be less.
- Free from wear adjustment.
- Less power consumption.
- Less skill technicians is sufficient to operate.
- Installation is simplified very much More efficient.
- Power can be easily transmitted.
- less loss in transmission.
- Very easy holding process.
- It requires simple maintenance cares checking and Cleaning are easy because of the main parts are screwed.
- Handling is easy.
- Repairing is easy.
- Replacement of parts is Easy.

Some of Disadvantages are as follows:

- Less load carrying capacity as compare to hydraulic system.
- Air compressor is required.
- Higher operating cost.
- Compressor required for this system is quite bit noisy.
- Due to sliding motion of parts, more wear & tear occurs.

VIII. APPLICATIONS

The following applications are considered of material handling processes.

- **Packing:** packing is that puts goods into boxes to protect them and to make them easier to carry while in transit. In this the required quantity of the material is loaded in trailer and can be unloaded at required direction.
- **Material loading:** In this, any bulk and unit load can be loaded, transported and unloaded at required place and required direction.
- **Dispensing:** dispensing is distributed or weighted out in carefully determined portions. In which material is distributed at any three directional places.
- **Palletizing:** In this the material is filled in pallets and these pallets are carried or supported by trailer and transported to required place by using forklift.
- **Material dropdown:** the finished products in machine are dropdown by using pneumatic trailer.
- **Pick & place:** pick up and placement of all types of materials at required place.

IX. FUTURE SCOPE

As the world progressing at faster rate we meet mover and mover huge construction which head to be dig big and big

amount of the earth and thus more efficiently working equipment are to be required and hence the Development of Three Axis Modern Pneumatic trailer may be used more than the two way or one way. India is progressing at higher rate and hence infrastructural development is on its high. Hence the future of this project work seems promising. The project work can be modified further more on following basis:

- Dual stage cylinders can be used.
- This system can be used by using hydraulic system instead of pneumatic systems for higher loads.
- Wheel steering can be adopted for avoiding the lifting of vehicle along with trailers.
- Sensors and alarms can be used to avoid risks.
- This arrangement can fitted on Automated Guided Vehicles (AGV).
- This system can be used in heavy vehicles like dumpers etc with the help of hydraulics.
- In automation industries this system can be used with the help PLC system.

X. CONCLUSION

The developed prototype exhibits the expected results. Further modifications and working limitations will put this work in the main league of use. This concept saves time & energy which leads to efficient working. This further line should be modeled using equations and an experimental agreement. The constructional work or the infrastructural work demands efficient and user friendly machinery which will lead to more and more use of three Axis Modern Pneumatic trailer.
